In order to upload the index page to your public_html folder you should perform the following actions:

1. Open your public_html folder, find index.html file (or index.htm, index.php)- all you need is to point out the name of the start page of your site (e.g. mainpage.html);
2. Enter your cPanel and click the icon "File manager" with the help of which you can upload this index page to your public_html folder;
3. After uploading this file via FTP or File manager you need to check if everything was done correctly entering in the browser the following link: <http://yourdomain/index.html> where index.html is the main page of your site;
4. Then you need to access your .htaccess file (create it in you public_html if you haven't one) and write the following string right here: `DirectoryIndex mainpage.html`.

Note: If your main page has filename like index.php, index.html or index.htm - you do not need to change DirectoryIndex statement.
